Blyth Sewage Treatment Plant 2023 Annual Report

Owned by the Township of North Huron and Operated by Veolia Water Canada

Blyth Sewage Treatment Plant 2023 Annual Report

Blyth STP Environmental Compliance Approval #9189-A6UPSM & (DRAFT CLI ECA 090-W601 Issue #1)

The Following is a summary and discussion of the 2023 Blyth Sewage treatment plant operation and summary of compliance limits as set forth in the ECA.

The Annual Average Rated Capacity of the Treatment Unit is 730 m3/d with Peak Capacity of 2730 m3/d.

Based on Raw Sewage Flows, the 2023 annual average flows were 443m3/day which represents 60.7% of the annual 730 m3/day capacity. The Peak flow of 1634m3/d occurred in April 2023 and represents 60% of the Peak Capacity of the plant.

Bypass Events

There were 8 bypass events for the Blyth Sewage Treatment plant in 2023, all of the bypasses were measured secondary bypasses. The bypasses occurred due to heavy precipitation and/or spring runoff, the aging filters are also contributing factors in the bypasses as they cannot handle the higher flows which are occurring now with less flow than we have historically seen them handle. The longest bypass was in February with 61.34 hours of secondary bypassing. The total number of bypass hours for 2023 were: 282 Secondary bypass hours with a total measured volume of 11,561m3

Compliance limits

The plant consistently removed 98.4% Biological Oxygen demand, 97.7% total suspended solids, 90.9% phosphorous and 94.1% total kjeldahl nitrogen which is well within the range of removals for a tertiary sewage plant and consistent with previous yearly operations other than a slight drop in phosphorus removal.

In May 2023 our Monthly Geometric Mean for E.Coli exceeded our Limit of 200cfu/100mL with a Monthly Geometric Mean result of 401cfu/100mL- this exceedance was reported to our MECP Inspector at month end

Operational problems

The Blyth Sewage treatment plant has been dechlorinating the final effluent using calcium thiosulfate since April 2022, in 2023 we had an average chlorine residual of 0.01mg/L. The Township has Engineering working on The UV system and sand filters for the Blyth Sewage treatment plant which should be installed and completed in the future. The Filters have been plugging and not backwashing efficiently- Many corrective actions and troubleshooting has occurred to try to alleviate the number of Bypasses including replenishing the filter media, monitoring the number of backwashes

Noticing Ferric Pump is not always Dosing correctly- corrective action to monitor Ferric pump dose more closely and Ferric Tank Measurements with a new Monthly work order developed starting in 2024.

Maintenance

Routine maintenance was performed throughout the year, according to the computerized maintenance program Jobsplus.

Unplanned maintenance activities in 2023:

Repair breaker board for clarifier arm

New pH sensor

Generator Replaced Belts and gauges, installed new guard over belt

Filter Media ordered and replenished

Installed new knife gate valve

Cleaned Grit Channel

Quality Control Monitoring

Monitoring includes an online dissolved oxygen sensor which indicates loading and raw sewage quality, aeration basin solids content and proper operations of the aerators. Secondary clarifier effluent is monitored for dissolved phosphorous to determine adequate ferric chloride dosage in aeration basins as well as general clarity and surface debris which indicates proper solids removal. Adequate return to the aeration and wasting rates.

The flowmeter measures the flow out of the treatment plant and is used to base dosages and treatment plant capacity. Results of monitoring activities can be viewed on the monthly spreadsheets.

Calibration and Maintenance

The flowmeters are calibrated annually. Advanced Meter Systems calibrated the flow meters and the V-Notch weir, the certificates are stored at the PUC Office. We aim to Calibration the pH analyzer monthly and record it in the log books and daily site spreadsheets- calibration was not recorded on the pH analyzer in January 2023.

Efforts to meet effluent objectives

As described in the quality control monitoring section, analytic and visual parameters are used as indicators of process efficiency and should fall within the critical control points. A summary of values was developed and is in the Blyth sewage treatment facility operations manual for reference and historically have been adequate to maintain compliance.

Biosolids Generated

A total of 972cubic meters were utilized in 2023 and hauled/applied by Ontario Greenways Inc to agriculture lands.

We would predict roughly 900m³ will be utilized, hauled and applied in 2024.

Complaints

There were no complaints to report during the 2023 operating year.
